I. Overview & Target Users

Study Buddy Matcher is a platform designed to pair students based on shared classes, study habits, and free schedule windows, while providing a dedicated space to seamlessly share and access study materials

Target Users: Students enrolled at the University of San Carlos (USC).

II. Problem Statement

Students often struggle to connect with compatible study partners who share the same courses and overlapping schedules, while also lacking a centralized way to discover and exchange relevant study materials. This leads to isolated preparation and highly inefficient collaborative learning.

III. Product Backlog Items

- 1. USC Student Authentication**
- 2. Academic Profile Setup**
- 3. Availability Matrix**
- 4. Smart Matching**
- 5. Connection Request System**
- 6. In-App Messaging**
- 7. In-Chat File Attachments**
- 8. Shared Resource Repository**

IV. Backlog User Stories

1. USC Students Authentication

- To authenticate using my official USC university email so that I can securely access the Study Buddy Matcher platform as a verified student.

2. Smart Matching

- A system to find compatible study buddies based on my courses, study preferences, and availability so that I can quickly connect with students who are suitable study partners.

3. Availability Matrix

- To enter the days and times when I am available to study so that the system can use my schedule to find study buddies who are available at similar times.

V. Sprint 1 Scope: *(what we can realistically deliver in sprint 1)*

For Sprint 1, we will deliver only **USC Student Authentication** and **Academic Profile Setup**. These two items are dependent on each other (a student's academic profile — including enrolled courses — can only exist once their identity is verified), and together they produce a visible, demoable result: a student can sign up with their university email and set up an academic profile showing their enrolled courses. We are excluding **Availability Matrix** because it requires a separate UI component (a schedule/calendar grid) and isn't essential to proving out the core account-and-profile flow first. Since this is our team's first sprint, we are also keeping scope conservative to account for unknown velocity.

VI. Sprint Goal:

By the end of Sprint 1, students can create a verified USC account and set up their academic profile, laying the foundation for future study-partner matching.
